#### HIGHLIGHTS OF PRESCRIBING INFORMATION These highlights do not include all the information needed to use INVOKANA® safely and effectively. See full prescribing information for INVOKANA.

INVOKANA (canagliflozin) tablets, for oral use Initial U.S. Approval: 2013

#### WARNING: LOWER LIMB AMPUTATION See full prescribing information for complete boxed warning.

- In patients with type 2 diabetes who have established cardiovascular disease (CVD) or at risk for CVD, INVOKANA has been associated with lower limb amputations, most frequently of the toe and midfoot; some also involved the leg (5.1)
- Before initiating, consider factors that may increase the risk of amputation. Monitor patients receiving INVOKANA for infections or ulcers of the lower limbs, and discontinue if these occur. (5.1)

-----RECENT MAJOR CHANGES-----

Boxed Warning	07/2017
Warnings and Precautions (5.1)	07/2017

#### -----INDICATIONS AND USAGE----

INVOKANA is a sodium-glucose co-transporter 2 (SGLT2) inhibitor indicated as an adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus (1)

#### Limitation of Use:

• Not for treatment of type 1 diabetes mellitus or diabetic ketoacidosis (1)

#### -DOSAGE AND ADMINISTRATION-

- The recommended starting dose is 100 mg once daily, taken before the first meal of the day (2.1)
- Dose can be increased to 300 mg once daily in patients tolerating INVOKANA 100 mg once daily who have an eGFR of 60 mL/min/1.73 m<sup>2</sup> or greater and require additional glycemic control (2.1)
- Assess renal function before initiating and periodically thereafter. (2.2)
- Limit the dose of INVOKANA to 100 mg once daily in patients who have an eGFR of 45 to less than 60 mL/min/1.73 m<sup>2</sup> (2.2)
- Initiation or use of INVOKANA is not recommended if eGFR is below 45 mL/min/1.73 m<sup>2</sup> (2.2)

-----DOSAGE FORMS AND STRENGTHS------

Tablets: 100 mg, 300 mg (3)

#### ---CONTRAINDICATIONS-----

- History of serious hypersensitivity reaction to INVOKANA (4)
- Severe renal impairment, ESRD, or on dialysis (4)

#### -----WARNINGS AND PRECAUTIONS------WARNINGS AND PRECAUTIONS--------

- Lower Limb Amputation: See boxed warning (5.1)
- Hypotension: Before initiating INVOKANA, assess volume status and correct hypovolemia in patients with renal impairment, the elderly, in

patients with low systolic blood pressure, or if on diuretics, ACEi, or ARB. Monitor for signs and symptoms during therapy (5.2)

- Ketoacidosis: Assess patients who present with signs and symptoms of metabolic acidosis for ketoacidosis, regardless of blood glucose level. If suspected, discontinue INVOKANA, evaluate and treat promptly. Before initiating INVOKANA, consider risk factors for ketoacidosis. Patients on INVOKANA may require monitoring and temporary discontinuation of therapy in clinical situations known to predispose to ketoacidosis (5.3)
- Acute kidney injury and impairment in renal function: Consider temporarily discontinuing in settings of reduced oral intake or fluid losses. If acute kidney injury occurs, discontinue and promptly treat. Monitor renal function during therapy (5.4)
- Hyperkalemia: Monitor potassium levels in patients with impaired renal function and in patients predisposed to hyperkalemia (2.2, 5.5, 6.1, 8.6)
- Urosepsis and Pyelonephritis: Evaluate patients for signs and symptoms of urinary tract infections and treat promptly, if indicated (5.6)
- Hypoglycemia: Consider a lower dose of insulin or the insulin secretagogue to reduce the risk of hypoglycemia when used in combination with INVOKANA (5.7)
- Genital mycotic infections: Monitor and treat if indicated (5.8)
- Hypersensitivity reactions: Discontinue INVOKANA and monitor until signs and symptoms resolve (5.9)
- Bone fracture: Consider factors that contribute to fracture risk before initiating INVOKANA (5.10)
- Increased LDL-C: Monitor LDL-C and treat if appropriate (5.11)

#### -----ADVERSE REACTIONS---

· Most common adverse reactions associated with INVOKANA (5% or greater incidence): female genital mycotic infections, urinary tract infection, and increased urination (6.1)

To report SUSPECTED ADVERSE REACTIONS, contact Janssen Pharmaceuticals, Inc. at 1-800-526-7736 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

#### -----DRUG INTERACTIONS------

- UGT inducers (e.g., rifampin): Canagliflozin exposure is reduced. Consider increasing dose from 100 mg to 300 mg (2.3, 7.1)
- Digoxin: Monitor digoxin levels (7.2)

#### --- USE IN SPECIFIC POPULATIONS-----

- Pregnancy: Advise females of the potential risk to a fetus especially during the second and third trimesters. (8.1)
- Lactation: INVOKANA is not recommended when breastfeeding (8.2)
- Geriatrics: Higher incidence of adverse reactions related to reduced intravascular volume (5.2, 8.5)
- Renal impairment: Higher incidence of adverse reactions related to reduced intravascular volume and renal function (2.2, 5.4, 8.6)
- Hepatic impairment: Not recommended with severe hepatic impairment (8.7)

See 17 for PATIENT COUNSELING INFORMATION and Medication Guide.

#### FULL PRESCRIBING INFORMATION

#### WARNING: LOWER LIMB AMPUTATION

- An approximately 2-fold increased risk of lower limb amputations associated with INVOKANA u se w as o bserved i n CANVAS a nd CANVAS -R, t wol arge, randomized, pl acebo-controlled t rials i n pa tients with t ype 2 d iabetes w ho ha d established cardiovascular disease (CVD) or were at risk for CVD.
- Amputations of the toe and midfoot were most frequent; however, amputations involving t he leg were al so ob served. S ome p atients h ad multiple amputations, some involving both limbs.
- Before initiating, consider factors that may increase the risk of amputation, such as a h istory of p rior a mputation, p eripheral vas cular d isease, n europathy, an d diabetic foot ulcers.
- Monitor p atients recei ving I NVOKANA f or i nfection, new pain o r t enderness, sores o r u lcers i nvolving t he lower limbs, and d iscontinue if t hese complications occur [see Warnings and Precautions (5.1)].

# 1 INDICATIONS AND USAGE

INVOKANA<sup>®</sup> (canagliflozin) is indicated as an adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus [*see Clinical Studies (14)*].

#### Limitation of Use

INVOKANA is not recommended in patients with type 1 diabetes mellitus or for the treatment of diabetic ketoacidosis.

# 2 DOSAGE AND ADMINISTRATION

#### 2.1 Recommended Dosage

The r ecommended s tarting dos e of INVOKANA (canagliflozin) is 100 mg once daily, t aken before the first meal of the day. In patients tolerating INVOKANA 100 mg once daily who have an eGFR of 60 mL/min/1.73 m<sup>2</sup> or greater and require additional glycemic control, the dose can be i ncreased t o 300 mg o nce d aily *[see Warnings and Precautions (5.4), Clinical Pharmacology (12.2), and Patient Counseling Information (17)]*.

In patients with volume depletion, correcting this condition prior to initiation of INVOKANA is recommended [see Warnings and Precautions (5.2), Use in Specific Populations (8.5 and 8.6), and Patient Counseling Information (17)].

#### 2.2 Patients with Renal Impairment

Assessment of renal function is recommended prior to initiation of INVOKANA and periodically thereafter.

The dos e of INVOKANA is limited to 100 mg o nce d aily in patients with mo derate r enal impairment with an eGFR of 45 to less than 60 mL/min/ $1.73 \text{ m}^2$ .

Initiation of INVOKANA is not r ecommended in p atients w ith a n e GFR less t han  $45 \text{ mL/min}/1.73 \text{ m}^2$ .

Use of INVOKANA is not r ecommended when eG FR i s p ersistently l ess t han 45 mL/min/1.73 m<sup>2</sup> [see Warnings and Precautions (5.4) and Use in Specific Populations (8.6)].

INVOKANA is c ontraindicated in pa tients with a n e GFR less t han 30 mL/min/1.73 m<sup>2</sup> [see Contraindications (4)].

# 2.3 Concomitant Use with UDP-Glucuronosyl Transferase (UGT) Enzyme Inducers

If an inducer of UGTs (e.g., rifampin, phe nytoin, phe nobarbital, r itonavir) is c o-administered with INVOKANA, c onsider increasing the dos age to 300 mg onc e daily in patients currently tolerating INVOKANA 100 mg once daily who have an eGFR of 60 mL/min/1.73 m<sup>2</sup> or greater and require additional glycemic control [see Drug Interactions (7.1)].

Consider a nother antihyperglycemic agent i n pa tients w ith a n e GFR of 45 to le ss th an  $60 \text{ mL/min}/1.73 \text{ m}^2$  receiving concurrent therapy with a UGT inducer.

# **3 DOSAGE FORMS AND STRENGTHS**

- INVOKANA 100 mg tablets are yellow, capsule-shaped, film-coated tablets with "CFZ" on one side and "100" on the other side.
- INVOKANA 300 mg tablets are white, capsule-shaped, film-coated tablets with "CFZ" on one side and "300" on the other side.

# **4** CONTRAINDICATIONS

- History of a serious hypersensitivity reaction to INVOKANA, such as an aphylaxis or angioedema [see Warnings and Precautions (5.9) and Adverse Reactions (6.1, 6.2)].
- Severe r enal impairment (eGFR less than 30 mL/min/1.73 m<sup>2</sup>), end s tage r enal d isease (ESRD), or patients on dialysis [see Warnings and Precautions (5.4) and Use in Specific Populations (8.6)].

# 5 WARNINGS AND PRECAUTIONS

# 5.1 Lower Limb Amputation

An approximately 2-fold increased risk of lower limb amputations associated with INVOKANA use was o bserved in C ANVAS and C ANVAS-R, t wo large, r andomized, placebo-controlled trials evaluating patients with type 2 diabetes who had either established cardiovascular disease or were at r isk for cardiovascular d isease. In C ANVAS, I NVOKANA-treated patients a nd placebo-treated patients had 5.9 and 2.8 amputations per 1000 patients per year, respectively. In CANVAS-R, I NVOKANA-treated p atients and p lacebo-treated p atients had 7.5 a nd 4.2 amputations per 1000 p atients per year, respectively. The risk of lower limb amputations was observed at both the 100 mg and 300 mg once daily dosage regimens. The amputation data for CANVAS and CANVAS-R are shown in Tables 2 and 3, respectively *[see Adverse Reactions (6.1)].* 

Amputations of t he t oe a nd m idfoot (99 out of 140 pa tients w ith a mputations r eceiving INVOKANA in the two trials) were the most frequent; however, amputations involving the leg, below and above the knee, were also observed (41 out of 140 patients with amputations receiving INVOKANA in the two trials). S ome patients had multiple amputations, s ome in volving b oth lower limbs.

Lower limb infections, gangrene, and diabetic foot ulcers were the most common precipitating medical events leading to the need for an amputation. The risk of a mputation was highest in patients with a baseline history of prior amputation, peripheral vascular disease, and neuropathy.

Before initiating INVOKANA, consider factors in the patient history that may predispose to the need f or a mputations, such a s a hi story of p rior a mputation, pe ripheral v ascular di sease, neuropathy and di abetic f oot ul cers. C ounsel pa tients a bout t he importance of r outine preventative f oot c are. Monitor pa tients r eceiving INVOKANA f or s igns a nd s ymptoms of infection (including osteomyelitis), new pain or tenderness, sores or ulcers involving the lower limbs, and discontinue INVOKANA if these complications occur.

# 5.2 Hypotension

INVOKANA causes intravascular volume contraction. Symptomatic hypotension can occur after initiating INVOKANA *[see Adverse Reactions (6.1)]* particularly in patients with impaired renal function (eGFR less than 60 mL/min/1.73 m<sup>2</sup>), elderly patients, patients on either di uretics or medications th at in terfere w ith th e r enin-angiotensin-aldosterone s ystem (e.g., angiotensin-converting-enzyme [ACE] i nhibitors, a ngiotensin r eceptor bl ockers [ARBs]), or patients w ith low systolic blood pressure. Before initiating INVOKANA in patients with one or more of these characteristics, volume status should be assessed and corrected. Monitor for signs and symptoms after initiating therapy.

#### 5.3 Ketoacidosis

Reports of ketoacidosis, a serious life-threatening condition requiring urgent hospitalization have been identified in postmarketing surveillance in patients with type 1 and type 2 diabetes mellitus receiving s odium g lucose co-transporter-2 (SGLT2) i nhibitors, i ncluding I NVOKANA. Fatal cases of ketoacidosis have be en reported in patients taking INVOKANA. INVOKANA is not indicated f or the tr eatment of p atients with type 1 d iabetes me llitus *[see Indications and Usage (1)]*.

Patients treated with INVOKANA who present with signs and symptoms consistent with severe metabolic a cidosis should be assessed for ke toacidosis regardless of presenting blood glucose levels, as ketoacidosis associated with INVOKANA may be present even if blood glucose levels are less t han 2 50 mg/dL. If ke toacidosis i s suspected, INVOKANA s hould be di scontinued, patient should be evaluated, and prompt treatment should be instituted. Treatment of ketoacidosis may require insulin, fluid and carbohydrate replacement.

In m any of t he pos tmarketing r eports, a nd particularly i n patients w ith t ype 1 di abetes, t he presence of k etoacidosis w as not i mmediately r ecognized a nd i nstitution of t reatment w as delayed because presenting blood glucose levels were below those typically expected for diabetic ketoacidosis (often less than 250 mg/dL). S igns and s ymptoms at presentation w ere consistent with dehydration and severe metabolic acidosis and included nausea, vomiting, abdominal pain, generalized malaise, and shortness of breath. In some but not all cases, factors predisposing to ketoacidosis such as insulin dose reduction, a cute febrile illness, reduced caloric intake due to illness or s urgery, pa ncreatic di sorders s uggesting insulin de ficiency (e.g., t ype 1 di abetes, history of pancreatitis or pancreatic surgery), and alcohol abuse were identified.

Before i nitiating INVOKANA, c onsider f actors in t he pa tient hi story t hat m ay pr edispose t o ketoacidosis i neluding pa nereatic i nsulin de ficiency f rom a ny c ause, c aloric r estriction, a nd alcohol abuse. In patients treated with INVOKANA consider monitoring for ketoacidosis and temporarily di scontinuing I NVOKANA in clinical s ituations know n t o pr edispose t o ketoacidosis (e.g., prolonged fasting due to acute illness or surgery).

# 5.4 Acute Kidney Injury and Impairment in Renal Function

INVOKANA causes intravascular volume contraction [see Warnings and Precautions (5.2)] and can cau se renal imp airment [see Adverse Reactions (6.1)]. There have be en postmarketing reports of acute kidney injury, some requiring hospitalization and dialysis, in patients receiving INVOKANA; some reports involved patients younger than 65 years of age.

Before in itiating INVOKANA, consider factors t hat may predispose patients to a cute ki dney injury i ncluding hypovolemia, chronic r enal insufficiency, congestive h eart failure and

6

concomitant me dications ( diuretics, A CE in hibitors, A RBs, N SAIDs). C onsider t emporarily discontinuing INVOKANA in any setting of reduced oral intake (such as acute illness or fasting) or fluid losses (such as gastrointestinal illness or excessive heat exposure); monitor patients for signs a nd s ymptoms of a cute ki dney i njury. If acute ki dney i njury occurs, di scontinue INVOKANA promptly and institute treatment.

INVOKANA increases serum creatinine and decreases eGFR. Patients with hypovolemia may be more s usceptible t o t hese c hanges. R enal f unction a bnormalities c an oc cur a fter i nitiating INVOKANA *[see Adverse Reactions (6.1)]*. Renal f unction s hould be e valuated p rior t o initiation of INVOKANA and monitored periodically thereafter. D osage a djustment and m ore frequent r enal f unction m onitoring are recommended i n pa tients w ith a n e GFR be low 60 mL/min/1.73 m<sup>2</sup>. Use of INVOKANA is not recommended when e GFR is persistently less than 45 mL/min/1.73 m<sup>2</sup> and i s c ontraindicated i n pa tients w ith an e GFR 1 ess t han 30 mL/min/1.73 m<sup>2</sup> *[see Dosage and Administration (2.2), Contraindications (4) and Use in Specific Populations (8.6)]*.

# 5.5 Hyperkalemia

INVOKANA can lead to hyperkalemia. Patients with moderate renal impairment who are taking medications that in terfere with p otassium e xcretion, s uch a s p otassium-sparing di uretics, or medications that interfere with the renin-angiotensin-aldosterone system are at an increased risk of developing hyperkalemia [see Dosage and Administration (2.2) and Adverse Reactions (6.1)].

Monitor s erum p otassium le vels p eriodically after in itiating INVOKANA in p atients w ith impaired renal function and in patients predisposed to hyperkalemia due to medications or other medical conditions.

# 5.6 Urosepsis and Pyelonephritis

There have been postmarketing reports of serious urinary tract infections including urosepsis and pyelonephritis r equiring h ospitalization in p atients r eceiving SGLT2 i nhibitors, i ncluding INVOKANA. T reatment with SGLT2 inhibitors increases the risk for urinary tract in fections. Evaluate p atients f or s igns and s ymptoms of urinary t ract i nfections and t reat pr omptly, i f indicated [see Adverse Reactions (6)].

# 5.7 Hypoglycemia with Concomitant Use with Insulin and Insulin Secretagogues

Insulin and insulin secretagogues are known to cause hypoglycemia. INVOKANA can increase the risk of hypoglycemia when combined with insulin or an insulin secretagogue [see Adverse Reactions (6.1)]. Therefore, a lower dose of insulin or insulin secretagogue may be required to minimize the risk of hypoglycemia when used in combination with INVOKANA.

#### 5.8 Genital Mycotic Infections

INVOKANA increases the risk of genital mycotic infections. Patients with a history of genital mycotic in fections a nd u ncircumcised m ales were more likely to develop genital mycotic infections [see Adverse Reactions (6.1)]. Monitor and treat appropriately.

#### 5.9 Hypersensitivity Reactions

Hypersensitivity r eactions, including a ngioedema a nd a naphylaxis, ha ve be en r eported w ith INVOKANA. These r eactions generally oc curred w ithin hour s t o da ys a fter i nitiating INVOKANA. If h ypersensitivity r eactions oc cur, di scontinue us e of INVOKANA; t reat a nd monitor unt il s igns a nd s ymptoms r esolve [see Contraindications (4) and Adverse Reactions (6.1, 6.2)].

#### 5.10 Bone Fracture

An increased risk of bone fracture, occurring as early as 12 weeks after treatment initiation, was observed in patients using INVOKANA. Consider factors that contribute to fracture risk prior to initiating INVOKANA [see Adverse Reactions (6.1)].

# 5.11 Increases in Low-Density Lipoprotein (LDL-C)

Dose-related i ncreases i n LDL-C o ccur wi th INVOKANA [see Adverse Reactions (6.1)]. Monitor LDL-C and treat if appropriate after initiating INVOKANA.

#### 5.12 Macrovascular Outcomes

There h ave b een n o clinical s tudies es tablishing conclusive ev idence of m acrovascular r isk reduction with INVOKANA [see Adverse Reactions (6.1)].

# 6 ADVERSE REACTIONS

The following important adverse reactions are described below and elsewhere in the labeling:

- Lower Limb Amputation [see Boxed Warning and Warnings and Precautions (5.1)]
- Hypotension [see Warnings and Precautions (5.2)]
- Ketoacidosis [see Warnings and Precautions (5.3)]
- Acute K idney Injury a nd Impairment in R enal F unction [see Warnings and Precautions (5.4)]
- Hyperkalemia [see Warnings and Precautions (5.5)]
- Urosepsis and Pyelonephritis [see Warnings and Precautions (5.6)]
- Hypoglycemia w ith C oncomitant U se w ith Insulin a nd Insulin S ecretagogues [see Warnings and Precautions (5.7)]

8

• Genital Mycotic Infections [see Warnings and Precautions (5.8)]

- Hypersensitivity Reactions [see Warnings and Precautions (5.9)]
- Bone Fracture [see Warnings and Precautions (5.10)]
- Increases in Low-Density Lipoprotein (LDL-C) [see Warnings and Precautions (5.11)]

#### 6.1 Clinical Studies Experience

Because clinical trials are conducted under widely varying conditions, ad verse reaction rates observed in the clinical trials of a drug cannot be directly compared to the rates in the clinical trials of another drug and may not reflect the rates observed in clinical practice.

#### Pool of Placebo-Controlled Trials

The da ta i n T able 1 i s de rived from f our 2 6-week p lacebo-controlled tr ials. In o ne tr ial INVOKANA w as u sed as m onotherapy and i n three trials INVOKANA w as u sed as ad d-on therapy *[see Clinical Studies (14)]*. These data reflect exposure of 1667 patients to INVOKANA and a mean duration of exposure to INVOKANA of 24 weeks. Patients received INVOKANA 100 mg (N=833), INVOKANA 300 mg (N=834) or placebo (N=646) once daily. The mean age of the population was 56 years and 2% were older than 75 years of age. Fifty percent (50%) of the population w as m ale a nd 72 % were C aucasian, 1 2% were Asian, a nd 5% were Black or African American. At b aseline the population h ad diabetes for an av erage of 7.3 years, h ad a mean H bA<sub>1C</sub> of 8.0 % and 20% had e stablished m icrovascular complications of di abetes. Baseline renal function was normal or mildly impaired (mean eGFR 88 mL/min/1.73 m<sup>2</sup>).

Table 1 s hows common ad verse r eactions as sociated w ith t he u se o f INVOKANA. T hese adverse reactions were not present at baseline, occurred more commonly on INVOKANA than on placebo, and occurred in at least 2% of patients treated with either INVOKANA 100 mg or INVOKANA 300 mg.

9

	Placebo	INVOKANA 100 mg	INVOKANA 300 mg
Adverse Reaction	N=646	N=833	N=834
Urinary tract infections <sup>‡</sup>	3.8%	5.9%	4.4%
Increased urination <sup>§</sup>	0.7%	5.1%	4.6%
Thirst <sup>#</sup>	0.1%	2.8%	2.4%
Constipation	0.9%	1.8%	2.4%
Nausea	1.6%	2.1%	2.3%
	N=312	N=425	N=430
Female genital mycotic infections <sup>†</sup>	2.8%	10.6%	11.6%
Vulvovaginal pruritus	0.0%	1.6%	3.2%
	N=334	N=408	N=404
Male genital mycotic infections <sup>1</sup>	0.7%	4.2%	3.8%

# Table 1: Adverse Reactions From Pool of Four 26–Week Placebo-Controlled Studies Reported in ≥ 2% of INVOKANA-Treated Patients\*

The four placebo-controlled trials included one monotherapy trial and three add-on combination trials with metformin, metformin and sulfonylurea, or metformin and pioglitazone.

Female genital mycotic infections include the following adverse reactions: Vulvovaginal candidiasis, Vulvovaginal mycotic infection, Vulvovaginitis, Vaginal infection, Vulvitis, and Genital infection fungal.

<sup>‡</sup> Urinary tract infections include the following adverse reactions: Urinary tract infection, Cystitis, Kidney infection, and Urosepsis.

Increased urination includes the following adverse reactions: Polyuria, Pollakiuria, Urine output increased, Micturition urgency, and Nocturia.
 Male genital mycotic infections include the following adverse reactions: Balanitis or Balanoposthitis, Balanitis candida, and Genital infection

fungal.

<sup>#</sup> Thirst includes the following adverse reactions: Thirst, Dry mouth, and Polydipsia.

Note: Percentages were weighted by studies. Study weights were proportional to the harmonic mean of the three treatment sample sizes.

Abdominal pa in w as a lso m ore c ommonly r eported i n pa tients t aking INVOKANA 100 mg (1.8%), 300 mg (1.7%) than in patients taking placebo (0.8%).

#### Pool of Placebo- and Active-Controlled Trials

The occurrence of adverse reactions for canagliflozin was evaluated in a larger pool of patients participating in placebo- and active-controlled trials.

The d ata combined e ight c linical tr ials *[see Clinical Studies (14)]* and r eflect e xposure of 6177 patients to INVOKANA. The mean duration of exposure to INVOKANA was 38 weeks with 1832 individuals e xposed t o I NVOKANA f or g reater t han 50 weeks. P atients r eceived INVOKANA 100 mg (N=3092), INVOKANA 300 mg (N=3085) or comparator (N=3262) once daily. The mean age of the population was 60 years and 5% were older than 75 years of a ge. Fifty-eight percent (58%) of the population was male and 73% were Caucasian, 16% were Asian, and 4% were Black or African American. At baseline, the population had diabetes for an average of 11 years, had a mean HbA<sub>1C</sub> of 8.0% and 33% had established microvascular complications of di abetes. Baseline r enal function w as nor mal or m ildly i mpaired ( mean e GFR 81 mL/min/1.73 m<sup>2</sup>).

The types and frequency of common a dverse reactions observed in the pool of eight clinical trials were consistent with those listed in Table 1. Percentages were weighted by studies. Study weights were proportional to the harmonic mean of the three treatment sample sizes. In this pool,

10

INVOKANA was also associated with the adverse reactions of fatigue (1.8% with comparator, 2.2% with INVOKANA 100 mg, and 2.0% with INVOKANA 300 mg) and loss of strength or energy (i.e., asthenia) (0.6% with comparator, 0.7% with INVOKANA 100 mg, and 1.1% with INVOKANA 300 mg).

In the pool of eight clinical trials, the incidence rate of pancreatitis (acute or chronic) was 0.1%, 0.2%, a nd 0.1% receiving comparator, INVOKANA 100 mg, a nd INVOKANA 3 00 mg, respectively.

In the pool of eight clinical trials, hypersensitivity-related adverse reactions (including erythema, rash, pruritus, urticaria, and angioedema) occurred in 3.0%, 3.8%, and 4.2% of patients receiving comparator, INVOKANA 1 00 mg, a nd I NVOKANA 300 mg, r espectively. Five p atients experienced serious adverse reactions of hypersensitivity with INVOKANA, which included 4 patients with urticaria and 1 pa tient with a diffuse rash and urticaria occurring within hours of exposure t o INVOKANA. A mong t hese pa tients, 2 pa tients di scontinued INVOKANA. O ne patient with urticaria had recurrence when INVOKANA was re-initiated.

Photosensitivity-related adverse reactions (including photosensitivity reaction, polymorphic light eruption, a nd s unburn) oc curred i n 0.1%, 0.2%, a nd 0.2% of pa tients r eceiving c omparator, INVOKANA 100 mg, and INVOKANA 300 mg, respectively.

Other adverse reactions occurring more frequently on INVOKANA than on comparator were:

# Lower Limb Amputation

An approximately 2-fold increased risk of lower limb amputations associated with INVOKANA use w as obs erved in CANVAS and CANVAS-R, t wo large, r andomized, pl acebo-controlled trials evaluating patients with type 2 diabetes who had either established cardiovascular disease or were at risk for cardiovascular disease. Patients in CANVAS and CANVAS-R were followed for a n a verage of 5.7 and 2.1 years, r espectively. T he a mputation data for C ANVAS and CANVAS-R are shown in Tables 2 and 3, respectively [see Warnings and Precautions (5.1)].

	Placebo N=1441	INVOKANA 100 mg N=1445	INVOKANA 300 mg N=1441	INVOKANA (Pooled) N=2886
Patients with an amputation, n (%)	22 (1.5)	50 (3.5)	45 (3.1)	95 (3.3)
Total amputations	33	83	79	162
Amputation incidence rate (per 1000 patient-years)	2.8	6.2	5.5	5.9
Hazard Ratio (95% CI)		2.24 (1.36, 3.69)	2.01 (1.20, 3.34)	2.12 (1.34, 3.38)

Table 2:CANVAS AMPUTATIONS

Note: Incidence is based on the number of patients with at least one amputation, and not the total number of amputation events. A patient's follow-up is calculated from Day 1 to the first amputation event date. Some patients had more than one amputation.

#### Table 3:CANVAS-R AMPUTATIONS

	Placebo N=2903	INVOKANA 100 mg (with up-titration to 300 mg) N=2904
Patients with an amputation, n (%)	25 (0.9)	45 (1.5)
Total amputations	36	59
Amputation incidence rate (per 1000 patient-years)	4.2	7.5
Hazard Ratio (95% CI)		1.80 (1.10, 2.93)

Note: Incidence is based on the number of patients with at least one amputation, and not the total number of amputation events. A patient's follow-up is calculated from Day 1 to the first amputation event date. Some patients had more than one amputation.

#### Volume Depletion-Related Adverse Reactions

INVOKANA r esults i n a n os motic di uresis, which m ay l ead t o r eductions i n i ntravascular volume. In clinical studies, treatment with INVOKANA was associated with a dose-dependent increase i n t he i ncidence o f v olume d epletion-related adverse r eactions ( e.g., hypotension, postural dizziness, or thostatic h ypotension, s yncope, and d ehydration). An increased incidence was obs erved i n pa tients on t he 300 mg d ose. The t hree f actors associated with t he l argest increase in volume depletion-related adverse reactions were the use of loop diuretics, moderate renal imp airment ( eGFR 3 0 to 1 ess t han 60 mL/min/1.73 m<sup>2</sup>), a nd age 75 years a nd ol der (Table 4) [see Dosage and Administration (2.2), Warnings and Precautions (5.2), and Use in Specific Populations (8.5 and 8.6)].

Table 4:Proportion of Patients With at Least One Volume Depletion-Related Adverse Reaction (Pooled<br/>Results from 8 Clinical Trials)

Baseline Characteristic	Comparator Group* %	INVOKANA 100 mg %	INVOKANA 300 mg %
Overall population	1.5%	2.3%	3.4%
75 years of age and older <sup><math>\dagger</math></sup>	2.6%	4.9%	8.7%
eGFR less than 60 mL/min/1.73 m <sup>2†</sup>	2.5%	4.7%	8.1%
Use of loop diuretic <sup>†</sup>	4.7%	3.2%	8.8%

\* Includes placebo and active-comparator groups

<sup>†</sup> Patients could have more than 1 of the listed risk factors

#### Falls

In a pool of nine clinical trials with mean duration of exposure to INVOKANA of 85 weeks, the proportion of p atients who e xperienced f alls was 1.3%, 1.5%, and 2.1% with c omparator, INVOKANA 1 00 mg, a nd INVOKANA 3 00 mg, r espectively. T he hi gher r isk of f alls f or patients treated with INVOKANA was observed within the first few weeks of treatment.

#### Impairment in Renal Function

INVOKANA is associated with a dose-dependent increase in serum creatinine and a concomitant fall in estimated GFR (Table 5). Patients with moderate renal impairment at baseline had larger mean changes.

			Placebo N=646	INVOKANA 100 mg N=833	INVOKANA 300 mg N=834
	Baseline	Creatinine (mg/dL)	0.84	0.82	0.82
Pool of Four	Dusenne	eGFR (mL/min/1.73 m <sup>2</sup> )	87.0	88.3	88.8
Placebo-	Weels 6 Change	Creatinine (mg/dL)	0.01	0.03	0.05
Controlled	week 6 Change	$eGFR (mL/min/1.73 m^2)$	-1.6	-3.8	-5.0
Iriais	End of Treatment Change*	Creatinine (mg/dL)	0.01	0.02	0.03
		eGFR (mL/min/1.73 m <sup>2</sup> )	-1.6	-2.3	-3.4
				INVOKANA	INVOKANA
			Placebo	100 mg	300 mg
			N=90	N=90	N=89
	Decolino	Creatinine (mg/dL)	1.61	1.62	1.63
Madanata Danal	Baseline	eGFR (mL/min/1.73 m <sup>2</sup> )	40.1	39.7	38.5
Moderate Renal Impairment Trial	Week 2 Change	Creatinine (mg/dL)	0.03	0.18	0.28
	week 5 Change	eGFR (mL/min/1.73 m <sup>2</sup> )	-0.7	-4.6	-6.2
	End of Treatment	Creatinine (mg/dL)	0.07	0.16	0.18
	Change*	eGFR (mL/min/1.73 m <sup>2</sup> )	-1.5	-3.6	-4.0

Table 5:	Changes in Serum Creatinine and eGFR Associated with INVOKANA in the Pool of Four
	Placebo-Controlled Trials and Moderate Renal Impairment Trial

Week 26 in mITT LOCF population

In the pool of four placebo-controlled trials where platients had normal or mild ly implaired baseline r enal function, the proportion of platients who experienced at l east on elevent of significant renal function decline, defined as an eGFR below 80 mL/min/1.73 m<sup>2</sup> and 30% lower than baseline, w as 2.1 % with placebo, 2.0 % with INVOKANA 1 00 mg, and 4.1 % with INVOKANA 3 00 mg. At the end of t reatment, 0.5% with placebo, 0.7% with INVOKANA 100 mg, and 1.4% with INVOKANA 300 mg had a significant renal function decline.

In a trial carried out in patients with moderate renal impairment with a baseline eGFR of 30 to less than 50 mL/min/1.73 m<sup>2</sup> (mean baseline eG FR 3.9 mL/min/1.73 m<sup>2</sup>) [see Clinical Studies (14.3)], the proportion of patients who experienced at l east one event of s ignificant r enal function de cline, d efined a s a n eGFR 30% l ower t han baseline, was 6.9% with placebo, 18% with INVOKANA 100 mg, and 22.5% with INVOKANA 300 mg. At the end of treatment, 4.6% with placebo, 3.4% with INVOKANA 100 mg, and 2.2% with INVOKANA 300 mg had a significant renal function decline.

In a pooled population of patients with moderate renal impairment (N=1085) with baseline eGFR of 30 to l ess than 60 mL/min/1.73 m<sup>2</sup> (mean b aseline eG FR 4 8 mL/min/1.73 m<sup>2</sup>), t he ove rall incidence of these events was lower than in the dedicated trial but a dose-dependent increase in incident episodes of significant renal function decline compared to placebo was still observed.

Use of INVOKANA has been as sociated with an increased incidence of renal-related adverse reactions (e.g., increased blood creatinine, decreased glomerular filtration rate, renal impairment, and acute renal failure), particularly in patients with moderate renal impairment.

In the pooled analysis of patients with moderate renal impairment, the incidence of renal-related adverse r eactions w as 3.7% with pl acebo, 8.9 % with INVOKANA 1 00 mg, and 9.3% with INVOKANA 3 00 mg. Discontinuations due t o r enal-related adverse ev ents o ccurred i n 1.0% with placebo, 1.2% with INVOKANA 100 mg, and 1.6% with INVOKANA 300 mg [see Warnings and Precautions (5.4)].

#### **Genital Mycotic Infections**

In t he pool of f our p lacebo-controlled c linical tr ials, f emale genital m ycotic in fections (e.g., vulvovaginal mycotic infection, vulvovaginal c andidiasis, and vulvovaginitis) oc curred in 2.8%, 10.6%, and 11.6% of f emales t reated w ith placebo, INVOKANA 1 00 mg, a nd INVOKANA 3 00 mg, r espectively. P atients with a history of genital mycotic in fections w ere more lik ely to d evelop g enital m ycotic in fections o n INVOKANA. Female p atients w ho developed genital mycotic infections on INVOKANA were more likely to experience recurrence and require treatment with oral or topical antifungal agents and anti-microbial agents. In females, discontinuation due to genital mycotic infections oc curred in 0% and 0.7% of patients treated with placebo and INVOKANA, respectively *[see Warnings and Precautions (5.8)]*.

In t he pool of f our placebo-controlled c linical tr ials, ma le genital m ycotic in fections (e.g., candidal balanitis, balanoposthitis) occurred in 0.7%, 4.2%, and 3.8% of males treated with placebo, INVOKANA 1 00 mg, and INVOKANA 3 00 mg, r espectively. M ale genital m ycotic infections occurred more commonly in uncircumcised males and in males with a prior history of balanitis or ba lanoposthitis. M ale pa tients w ho de veloped genital mycotic i nfections on INVOKANA were more likely to experience recurrent infections (22% on INVOKANA versus none on placebo), and require treatment with oral or topical antifungal agents and anti-microbial agents than patients on comparators. In males, discontinuations due to genital mycotic infections occurred in 0% and 0.5% of patients treated with placebo and INVOKANA, respectively. In the pooled a nalysis of 8 controlled trials, phi mosis w as reported in 0.3% of unc ircumcised m ale patients treated with INVOKANA and 0.2% required c ircumcision to treat the p himosis [see Warnings and Precautions (5.8)].

#### <u>Hypoglycemia</u>

In all clinical trials, h ypoglycemia was defined as an y event regardless of s ymptoms, where biochemical h ypoglycemia was documented (any glucose v alue b elow or equal to 70 mg/dL). Severe h ypoglycemia was defined as an event consistent with h ypoglycemia where the patient required the assistance of another person to recover, lost consciousness, or experienced a seizure (regardless of w hether biochemical doc umentation of a low glucose v alue was obtained). In individual c linical trials *[see Clinical Studies (14)]*, e pisodes of h ypoglycemia oc curred at a higher rate when INVOKANA was co-administered with insulin or sulfonylureas (Table 6) *[see Warnings and Precautions (5.7)]*.

Nonotherapy (26 weeks)         Placebo         INVOKANA 100 mg         INVOKANA 300 mg           (26 weeks) $(N=192)$ $(N=195)$ $(N=197)$ Overall [N (%)]         5 (2.6)         7 (3.6)         6 (3.0)           In Combination with Metformin         Placebo + Metformin         INVOKANA 100 mg + Metformin         INVOKANA 300 mg + Metformin           (26 weeks)         (N=183)         (N=368)         (N=367)           Overall [N (%)]         3 (1.6)         16 (4.3)         17 (4.6)           Severe [N (%)]         0 (0)         1 (0.3)         1 (0.3)           In Combination with Metformin         Glimepiride + Metformin         INVOKANA 100 mg + Metformin         INVOKANA 300 mg + Metformin           Severe [N (%)]         165 (34.2)         27 (5.6)         24 (4.9)           Severe [N (%)]         15 (3.1)         2 (0.4)         3 (0.6)           In Combination with Sulfonylurea         Placebo         INVOKANA 100 mg + NVOKANA 300 mg + Sulfonylurea         Sulfonylurea           In Combination with Metformin + Sulfonylurea         Sulfonylurea         Sulfonylurea         Sulfonylurea           (26 weeks)         (N=456)         (N=157)         (N=72)         Sulfonylurea           (26 weeks)         (N=156)         (N=157)         (N=15

 Table 6:
 Incidence of Hypoglycemia\* in Controlled Clinical Studies

#### Bone Fracture

The o ccurrence of bone fractures was evaluated in a p ool of n ine clinical trials with a m ean duration of exposure to INVOKANA of 85 weeks. The incidence r ates of a djudicated bon e fractures w ere 1.1, 1. 4, a nd 1.5 per 100 patient-years of exposure i n t he c omparator, INVOKANA 100 mg, and INVOKANA 300 mg groups, respectively. Fractures were observed as early as 12 weeks after treatment initiation and were more likely to be low trauma (e.g., fall from no m ore t han s tanding he ight), a nd a ffect t he upper e xtremities [see Warnings and Precautions (5.10)].

#### Laboratory and Imaging Tests

#### Increases in Serum Potassium

In a pool ed population of patients (N=723) with moderate r enal impairment (eGFR 45 to less than 60 mL/min/ $1.73 \text{ m}^2$ ), increases i n s erum pot assium t o g reater t han 5.4 mEq/L a nd 15% above b aseline o ccurred i n 5.3%, 5.0%, a nd 8.8% of pa tients treated with pl acebo, INVOKANA 100 mg, and INVOKANA 300 mg, respectively. Severe elevations (greater than or equal to 6.5 mEq/L) occurred in 0.4% of patients treated with placebo, no patients treated with INVOKANA 100 mg, and 1.3% of patients treated with INVOKANA 300 mg.

In these patients, i nereases i n pot assium were more commonly seen i n those with e levated potassium a t b aseline. Among p atients with mo derate renal imp airment, a pproximately 84% were ta king me dications that in terfere with p otassium e xcretion, s uch a s p otassium-sparing diuretics, a ngiotensin-converting-enzyme i nhibitors, a nd a ngiotensin-receptor b lockers *[see Warnings and Precautions (5.4 and 5.5) and Use in Specific Populations (8.6)]*.

#### Increases in Serum Magnesium

Dose-related increases in serum magnesium were observed early after initiation of INVOKANA (within 6 w eeks) and r emained e levated t hroughout t reatment. In the pool of four placebocontrolled trials, the mean percent change in serum magnesium levels was 8.1% and 9.3% with INVOKANA 100 mg and INVOKANA 300 mg, respectively, compared to -0.6% with placebo. In a tr ial o f p atients w ith mo derate r enal imp airment *[see Clinical Studies (14.3)]*, s erum magnesium levels increased by 0.2%, 9.2%, and 14.8% with placebo, INVOKANA 100 mg, and INVOKANA 300 mg, respectively.

Number of patients experiencing at least one event of hypoglycemia based on either biochemically documented episodes or severe hypoglycemic events in the intent-to-treat population

<sup>&</sup>lt;sup>†</sup> Severe episodes of hypoglycemia were defined as those where the patient required the assistance of another person to recover, lost consciousness, or experienced a seizure (regardless of whether biochemical documentation of a low glucose value was obtained)

#### Increases in Serum Phosphate

Dose-related increases in serum phosphate levels were observed with INVOKANA. In the pool of f our pl acebo c ontrolled t rials, t he m ean p ercent ch ange i n serum p hosphate l evels w ere 3.6% and 5.1% with INVOKANA 100 mg and INVOKANA 300 mg, respectively, compared to 1.5% with placebo. In a trial of patients with moderate renal impairment *[see Clinical Studies (14.3)]*, the m ean s erum phos phate levels i ncreased b y 1.2%, 5.0%, and 9.3% with placebo, INVOKANA 100 mg, and INVOKANA 300 mg, respectively.

# Increases in Low-Density Lipoprotein Cholesterol (LDL-C) and non-High-Density Lipoprotein Cholesterol (non-HDL-C)

In the pool of four placebo-controlled trials, dose-related increases in LDL-C with INVOKANA were obs erved. M ean changes (percent c hanges) from baseline in LDL-C relative t o p lacebo were 4 .4 mg/dL ( 4.5%) and 8.2 mg/dL ( 8.0%) with INVOKANA 1 00 mg and INVOKANA 300 mg, respectively. The mean baseline LDL-C levels were 104 to 110 mg/dL across treatment groups [see Warnings and Precautions (5.11)].

Dose-related increases in non-HDL-C with INVOKANA were observed. Mean changes (percent changes) from baseline in non-HDL-C relative to placebo were 2.1 mg/dL (1.5%) and 5.1 mg/dL (3.6%) with INVOKANA 1 00 mg and 300 mg, r espectively. The mean baseline n on-HDL-C levels were 140 to 147 mg/dL across treatment groups.

#### Increases in Hemoglobin

In the pool of four placebo-controlled trials, mean changes (percent changes) from baseline in hemoglobin were -0.18 g/dL (-1.1%) with placebo, 0.47 g/dL (3.5%) with INVOKANA 100 mg, and 0.51 g/dL (3.8%) with INVOKANA 3 00 mg. The mean baseline hemoglobin value was approximately 14.1 g/dL across treatment groups. At the end of treatment, 0.8%, 4.0%, and 2.7% of patients treated with placebo, INVOKANA 100 mg, and INVOKANA 300 mg, respectively, had hemoglobin above the upper limit of normal.

# Decreases in Bone Mineral Density

Bone mineral density (BMD) was measured by dual-energy X-ray absorptiometry in a clinical trial of 714 older adults (mean age 64 years) *[see Clinical Studies (14.3)]*. At 2 years, patients randomized to INVOKANA 100 mg and INVOKANA 300 mg had placebo-corrected declines in BMD at t he t otal hi p of 0.9% and 1.2%, respectively, and at the l umbar s pine of 0.3% and 0.7%, respectively. Additionally, placebo-adjusted BMD declines were 0.1% at the femoral neck for bot h INVOKANA dos es a nd 0.4% at the d istal f orearm f or p atients r andomized to INVOKANA 300 mg. The placebo-adjusted change at the distal forearm for patients randomized to INVOKANA 100 mg was 0%.

#### 6.2 Postmarketing Experience

Additional a dverse r eactions have be en i dentified during postapproval us e of INVOKANA. Because t hese r eactions are r eported v oluntarily from a population of uncertain s ize, it is generally not possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

Ketoacidosis [see Warnings and Precautions (5.3)]

Acute Kidney Injury and Impairment in Renal Function [see Warnings and Precautions (5.4)]

Anaphylaxis, Angioedema [see Warnings and Precautions (5.9)]

Urosepsis and Pyelonephritis [see Warnings and Precautions (5.6)]

#### 7 DRUG INTERACTIONS

#### 7.1 UGT Enzyme Inducers

Rifampin: C o-administration of c anagliflozin with r ifampin, a nons elective inducer of s everal UGT e nzymes, i ncluding U GT1A9, U GT2B4, de creased c anagliflozin a rea und er t he c urve (AUC) by 51%. This decrease in exposure to canagliflozin may decrease efficacy. If an inducer of these UGTs (e.g., rifampin, phenytoin, phenobarbital, ritonavir) must be co-administered with INVOKANA (canagliflozin), consider increasing the dose to 300 mg once d aily if patients are currently t olerating INVOKANA 1 00 mg once d aily, h ave an eG FR greater t han 60 mL/min/1.73 m<sup>2</sup>, and require additional glycemic control. Consider other antihyperglycemic therapy in patients with an eGFR of 45 to less than 60 mL/min/1.73 m<sup>2</sup> receiving co ncurrent therapy with a UGT i nducer a nd require a dditional g lycemic c ontrol [see Dosage and Administration (2.3) and Clinical Pharmacology (12.3)].

#### 7.2 Digoxin

There w as an increase in the A UC and m ean p eak d rug concentration ( $C_{max}$ ) of di goxin (20% and 36 %, respectively) when co-administered with INVOKANA 3 00 mg *[see Clinical Pharmacology (12.3)]*. P atients taking I NVOKANA with c oncomitant di goxin s hould be monitored appropriately.

#### 7.3 Positive Urine Glucose Test

Monitoring glycemic control with u rine glucose tests is not recommended in patients taking SGLT2 i nhibitors a s S GLT2 i nhibitors i ncrease ur inary glucose excretion and will lead to positive urine glucose tests. Use alternative methods to monitor glycemic control.

#### 7.4 Interference with 1,5-anhydroglucitol (1,5-AG) Assay

Monitoring g lycemic c ontrol w ith 1,5 -AG as say is n ot r ecommended as m easurements o f 1,5-AG are unreliable in assessing glycemic control in patients taking S GLT2 in hibitors. Use alternative methods to monitor glycemic control.

# 8 USE IN SPECIFIC POPULATIONS

#### 8.1 Pregnancy

#### **Risk Summary**

Based on an imal data showing adverse renal effects, INVOKANA is not recommended during the second and third trimesters of pregnancy.

Limited d ata with INVOKANA in p regnant w omen a re n ot sufficient to d etermine a d rugassociated risk for major birth defects or mis carriage. There are risks to the mother and fetus associated with poorly controlled diabetes in pregnancy [see Clinical Considerations].

In a nimal studies, a dverse r enal pe lvic a nd t ubule di latations t hat w ere not r eversible w ere observed i n r ats w hen canagliflozin was administered dur ing a p eriod of renal d evelopment corresponding to the late second and third trimesters of human pregnancy, at an exposure 0.5-times the 300 mg clinical dose, based on AUC.

The estimated background risk of major birth defects is 6-10% in women with pre-gestational diabetes with a HbA<sub>1c</sub> >7 and has been reported to be as high as 20-25% in women with a HbA<sub>1c</sub> >10. The estimated background risk of miscarriage for the indicated population is unknown. In the U.S. general population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2-4% and 15-20%, respectively.

#### **Clinical Considerations**

#### Disease-associated maternal and/or embryo/fetal risk

Poorly controlled diabetes in pregnancy increases the maternal risk for diabetic ketoacidosis, preeclampsia, spontaneous abortions, preterm delivery, stillbirth and delivery complications. Poorly controlled diabetes in creases the fetal risk for major birth defects, stillbirth, and ma crosomia related morbidity.

#### Animal Data

Canagliflozin dosed directly to juvenile rats from postnatal day (PND) 21 until PND 90 at doses of 4, 20, 65, or 100 mg/kg increased ki dney weights a nd dos e de pendently i ncreased t he incidence and severity of renal pelvic and tubular dilatation at all doses tested. Exposure at the lowest dose was greater than or equal to 0.5-times the 300 mg clinical dose, based on A UC. These outcomes occurred with drug exposure during periods of renal development in rats that

correspond to the late second and third trimester of human renal development. The renal pelvic dilatations observed in juvenile animals did not fully reverse within a 1 month recovery period.

In e mbryo-fetal d evelopment s tudies in r ats and r abbits, c anagliflozin w as a dministered f or intervals c oinciding w ith th e f irst t rimester pe riod of or ganogenesis i n hum ans. N o developmental toxicities independent of maternal toxicity were observed when canagliflozin was administered at doses up to 100 mg/kg in pregnant rats and 160 mg/kg in pregnant rabbits during embryonic organogenesis or during a study in which maternal rats were dosed from gestation day (GD) 6 t hrough PND 21, yielding exposures up t o approximately 19-times the 300 mg clinical dose, based on AUC.

# 8.2 Lactation

#### **Risk Summary**

There is no information regarding the presence of INVOKANA in human milk, the effects on the breastfed i nfant, or t he e ffects on m ilk production. C anagliflozin is present in t he m ilk of lactating rats *[see Data]*. Since human kidney maturation occurs *in utero* and during the first 2 years of life when lactational exposure may occur, there may be risk to the developing human kidney.

Because of the potential for serious adverse reactions in a breastfed infant, advise women that use of INVOKANA is not recommended while breastfeeding.

# <u>Data</u>

#### Animal Data

Radiolabeled canagliflozin administered to lactating rats on day 13 post-partum was present at a milk/plasma ratio of 1.40, indicating that canagliflozin and its metabolites are transferred in to milk at a concentration comparable t ot hat i n pl asma. Juvenile r ats directly e xposed t o canagliflozin showed a risk to the developing kidney (renal pelvic and tubular dilatations) during maturation.

# 8.4 Pediatric Use

Safety and effectiveness of INVOKANA in pediatric patients under 18 years of a ge have not been established.

# 8.5 Geriatric Use

Two thousand thirty-four (2034) patients 65 years and older, and 345 patients 75 years and older were e xposed t o INVOKANA i n n ine c linical s tudies o f INVOKANA [see Clinical Studies (14.3)].

Patients 6 5 years and o lder h ad a h igher i neidence o f adverse r eactions r elated t o r educed intravascular vol ume w ith INVOKANA (such as h ypotension, pos tural dizziness, or thostatic hypotension, s yncope, and de hydration), p articularly with the 300 mg daily dose, compared t o younger p atients; a m ore p rominent i ncrease i n t he i neidence w as s een i n p atients w ho w ere 75 years and older *[see Dosage and Administration (2.1) and Adverse Reactions (6.1)]*. Smaller reductions i n H bA<sub>1C</sub> with INVOKANA relative t o p lacebo were s een i n ol der (65 years and older; -0.61% wi th INVOKANA 1 00 mg a nd -0.74% with INVOKANA 300 mg r elative to p lacebo) c ompared t o younger pa tients (-0.72% with INVOKANA 1 00 mg a nd -0.87% with INVOKANA 300 mg relative to p lacebo).

# 8.6 Renal Impairment

The efficacy and safety of INVOKANA were evaluated in a s tudy that included patients with moderate r enal i mpairment (eGFR 30 t oless t han 50 mL/min/1.73 m<sup>2</sup>) [see Clinical Studies (14.3)]. These patients had less overall glycemic efficacy and had a higher occurrence of adverse r eactions related to reduced intravascular volume, renal-related ad verse r eactions, and decreases in eGFR compared to patients with mild renal impairment or normal renal function (eGFR greater than or equal to 60 mL/min/1.73 m<sup>2</sup>). Dose-related, transient mean increases in serum pot assium were observed e arly a fter initiation of INVOKANA (i.e., within 3 weeks) in this t rial. Increases i n s erum pot assium of greater than 5.4 mEq/L and 15% above b aseline occurred in 16.1%, 12.4%, and 27.0% of patients treated with placebo, INVOKANA 100 mg, and INVOKANA 300 mg, respectively. Severe elevations (greater than or equal to 6.5 mEq/L) occurred in 1.1%, 2.2%, and 2.2% of patients treated with placebo, INVOKANA 100 mg, and INVOKANA 3 00 mg, r espectively [see Dosage and Administration (2.2), Warnings and Precautions (5.2, 5.4, and 5.5), and Adverse Reactions (6.1)].

The efficacy and safety of INVOKANA have not been established in patients with severe renal impairment (eGFR le ss th an 3 0 mL/min/1.73 m<sup>2</sup>), with E SRD, or r eceiving di alysis. INVOKANA is not expected to be effective in these patient populations [see Contraindications (4) and Clinical Pharmacology (12.3)].

#### 8.7 Hepatic Impairment

No dosage adjustment is necessary in patients with mild or moderate hepatic impairment. The use of INVOKANA has not be enstudied in patients with severe hepatic impairment and is therefore not recommended [see Clinical Pharmacology (12.3)].

# **10 OVERDOSAGE**

There were no reports of overdose during the clinical development program of INVOKANA (canagliflozin).

In the event of an overdose, contact the Poison Control Center. It is also reasonable to employ the usual supportive measures, e.g., remove unabsorbed material from the gastrointestinal tract, employ clinical monitoring, and institute supportive treatment as dictated by the patient's clinical status. C anagliflozin w as ne gligibly r emoved dur ing a 4 -hour hemodialysis s ession. Canagliflozin is not expected to be dialyzable by peritoneal dialysis.

#### **11 DESCRIPTION**

INVOKANA ( canagliflozin) c ontains c anagliflozin, a n i nhibitor of s odium-glucose cotransporter 2 (SGLT2), the t ransporter r esponsible f or r eabsorbing t he m ajority of glucose filtered by the kidney. Canagliflozin, the active ingredient of INVOKANA, is chemically known as ( 1*S*)-1,5-anhydro-1-[3-[[5-(4-fluorophenyl)-2-thienyl]methyl]-4-methylphenyl]-D-glucitol hemihydrate a nd its mo lecular f ormula a nd w eight a re C  $_{24}H_{25}FO_5S\bullet1/2$  H  $_2O$  a nd 453.53, respectively. The structural formula for canagliflozin is:

Canagliflozin is practically insoluble in aqueous media from pH 1.1 to 12.9.

INVOKANA is supplied as f ilm-coated t ablets f or o ral administration, c ontaining 102 and 306 mg of c anagliflozin i n e ach t ablet s trength, c orresponding t o 100 mg a nd 300 mg o f canagliflozin (anhydrous), respectively.

Inactive i ngredients of t he core t ablet ar e croscarmellose s odium, h ydroxypropyl cellulose, lactose anhydrous, magnesium stearate, and microcrystalline cellulose. The magnesium stearate is v egetable-sourced. T he t ablets a refinished with a commercially a vailable f ilm-coating consisting of the following excipients: polyvinyl alcohol (partially hydrolyzed), titanium dioxide, macrogol/PEG, talc, and iron oxide yellow, E172 (100 mg tablet only).

#### **12 CLINICAL PHARMACOLOGY**

#### 12.1 Mechanism of Action

Sodium-glucose co -transporter 2 (SGLT2), e xpressed i n t he pr oximal r enal t ubules, i s responsible f or t he m ajority of t he r eabsorption of filtered glucose f rom t he t ubular l umen. Canagliflozin is an inhibitor of SGLT2. By inhibiting SGLT2, canagliflozin reduces reabsorption of filtered glucose a nd lowers t he r enal t hreshold f or glucose ( $RT_G$ ), and t hereby i ncreases urinary glucose excretion (UGE).

#### 12.2 Pharmacodynamics

Following single and multiple oral doses of canagliflozin in patients with type 2 diabetes, dosedependent decreases in the renal threshold for glucose ( $RT_G$ ) and increases in urinary glucose excretion were observed. From a starting  $RT_G$  value of approximately 240 mg/dL, canagliflozin at 100 mg and 300 mg onc e daily s uppressed  $RT_G$  throughout the 24 -hour period. M aximal suppression of m ean  $RT_G$  over the 24 -hour p eriod w as seen with the 300 mg daily dos e t o approximately 70 to 90 mg/dL in patients with type 2 diabetes in Phase 1 studies. The reductions in  $RT_G$  led t o i ncreases i n m ean U GE of a pproximately 100 g/day in s ubjects with type 2 diabetes treated with either 100 mg or 300 mg of canagliflozin. In patients with type 2 diabetes given 100 mg t o 300 mg o nce d aily o ver a 1 6-day dos ing p eriod, reductions i n  $RT_G$  and increases i n ur inary glucose e xcretion w ere ob served over t he dos ing period. In t his s tudy, plasma glucose d eclined i n a d ose-dependent fashion within the first day of dos ing. In singledose studies in healthy and type 2 diabetic subjects, treatment with canagliflozin 300 mg before a mixed-meal delayed intestinal glucose absorption and reduced postprandial glucose.

#### Cardiac Electrophysiology

In a r andomized, doubl e-blind, pl acebo-controlled, a ctive-comparator, 4 -way c rossover s tudy, 60 healthy subjects were administered a single or al dose of canagliflozin 300 mg, canagliflozin 1,200 mg (4 times t he m aximum r ecommended dos e), m oxifloxacin, a nd pl acebo. N o meaningful changes in QTc interval were observed with either the recommended dose of 300 mg or the 1,200 mg dose.

#### **12.3 Pharmacokinetics**

The p harmacokinetics of c anagliflozin is similar in h ealthy subjects and p atients with t ype 2 diabetes. Following single-dose oral administration of 100 mg and 300 mg of INVOKANA, peak plasma concentrations (median T max) of canagliflozin oc curs within 1 to 2 hours post-dose. Plasma C max and AUC of canagliflozin increased in a dose-proportional manner from 50 mg to 300 mg. The apparent terminal half-life ( $t_{1/2}$ ) was 10.6 hours and 13.1 hours for the 100 mg and 300 mg doses, respectively. Steady-state was reached after 4 to 5 days of once-daily dosing with canagliflozin 100 mg t o 300 mg. C anagliflozin d oes n ot e xhibit time -dependent

23

pharmacokinetics and accumulated in plasma up to 36% following multiple doses of 100 mg and 300 mg.

#### **Absorption**

The mean absolute oral bioavailability of canagliflozin is approximately 65%. Co-administration of a high-fat me al with canagliflozin h ad n o e ffect on the p harmacokinetics of canagliflozin; therefore, INVOKANA may be taken with or without food. However, based on the potential to reduce postprandial plasma glucose excursions due to delayed intestinal glucose absorption, it is recommended t hat INVOKANA b e t aken b efore t he first m eal of t he day [see Dosage and Administration (2.1)].

#### **Distribution**

The mean steady-state v olume of distribution of c anagliflozin f ollowing a single i ntravenous infusion in healthy subjects was 83.5 L, suggesting extensive tissue distribution. Canagliflozin is extensively bound t o proteins i n pl asma (99%), mainly to albumin. P rotein bi nding i s independent of canagliflozin plasma concentrations. Plasma protein binding is not meaningfully altered in patients with renal or hepatic impairment.

#### <u>Metabolism</u>

*O*-glucuronidation is the major metabolic elimination pathway for canagliflozin, which is mainly glucuronidated by UGT1A9 and UGT2B4 to two inactive *O*-glucuronide metabolites.

CYP3A4-mediated (oxidative) me tabolism of c anagliflozin is minimal (approximately 7%) in humans.

# Excretion

Following a dministration of a single oral [ $^{14}$ C] canagliflozin dos e t o he althy subjects, 41.5%, 7.0%, and 3.2% of the administered radioactive dose was recovered in feces as canagliflozin, a hydroxylated m etabolite, a nd a n *O*-glucuronide m etabolite, r espectively. E nterohepatic circulation of canagliflozin was negligible.

Approximately 33% of the a dministered r adioactive dos e w as e xcreted i n ur ine, m ainly as *O*-glucuronide m etabolites ( 30.5%). Less t han 1% of t he d ose w as excreted as u nchanged canagliflozin in urine. Renal clearance of canagliflozin 100 mg and 300 mg doses ranged from 1.30 to 1.55 mL/min.

Mean s ystemic cl earance o f can agliflozin w as ap proximately 1 92 mL/min in h ealthy s ubjects following intravenous administration.

#### **Specific Populations**

#### Renal Impairment

A s ingle-dose, op en-label s tudy evaluated t he pharmacokinetics of c anagliflozin 200 mg in subjects with varying degrees of renal impairment (classified using the MDRD-eGFR formula) compared to healthy subjects.

Renal impairment did not affect the  $C_{max}$  of canagliflozin. Compared to healthy subjects (N=3; eGFR greater than or equal to 90 mL/min/1.73 m<sup>2</sup>), plasma AUC of canagliflozin was increased by approximately 15%, 29%, and 53% in subjects with mild (N=10), moderate (N=9), and severe (N=10) r enal impairment, r espectively, (eGFR 60 to less than 90, 30 to less than 60 and 15 to less t han 30 mL/min/1.73 m<sup>2</sup>, r espectively), but w as s imilar f or E SRD (N=8) s ubjects a nd healthy subjects.

Increases in c anagliflozin A UC of this m agnitude a re not c onsidered cl inically r elevant. The pharmacodynamic r esponse t o can agliflozin d eclines w ith i ncreasing s everity o f r enal impairment [see Contraindications (4) and Warnings and Precautions (5.4)].

Canagliflozin was negligibly removed by hemodialysis.

#### Hepatic Impairment

Relative to subjects with normal hepatic function, the geometric mean ratios for  $C_{max}$  and  $AUC_{\infty}$  of canagliflozin were 107% and 110%, respectively, in subjects with Child-Pugh class A (mild hepatic i mpairment) a nd 96% and 111%, respectively, i n s ubjects with C hild-Pugh class B (moderate h epatic imp airment) f ollowing a dministration o f a s ingle 3 00 mg dos e of canagliflozin.

These differences are not considered to be clinically meaningful. There is no clinical experience in p atients w ith C hild-Pugh cl ass C ( severe) h epatic i mpairment *[see Use in Specific Populations (8.7)]*.

#### Pharmacokinetic Effects of Age, Body Mass Index (BMI)/Weight, Gender and Race

Based on t he population PK analysis with data collected from 1526 subjects, a ge, bod y mass index (BMI)/weight, ge nder, a nd r ace do not ha ve a c linically m eaningful e ffect on t he pharmacokinetics of canagliflozin *[see Use in Specific Populations (8.5)]*.

#### Pediatric

Studies characterizing the pharmacokinetics of canagliflozin in pediatric patients have not been conducted.

#### **Drug Interaction Studies**

#### In Vitro Assessment of Drug Interactions

Canagliflozin did not induce CYP450 enzyme expression (3A4, 2C9, 2C19, 2B6, and 1A2) in cultured human hepatocytes. Canagliflozin did not inhibit the CYP450 isoenzymes (1A2, 2A6, 2C19, 2D6, or 2E1) and weakly inhibited CYP2B6, CYP2C8, CYP2C9, and CYP3A4 based on *in vitro* studies with human hepatic microsomes. Canagliflozin is a weak inhibitor of P-gp.

Canagliflozin is also a substrate of drug transporters P-glycoprotein (P-gp) and MRP2.

# In Vivo Assessment of Drug Interactions

Co-Administered Drug	Dose of Co-Administered	Dose of Canagliflozin <sup>*</sup>	Geometric Mean Ratio (Ratio With/Without Co-Administered Drug) No Effect=1.0		
	Drug		AUC <sup>†</sup> (90% CI)	C <sub>max</sub> (90% CI)	
See Drug Interactions (7.1	() for the clinical relev	ance of the followi	ng:		
Rifampin	600 mg QD for 8 days	300 mg	0.49 (0.44; 0.54)	0.72 (0.61; 0.84)	
No dose adjustments of INVOKANA required for the following:					
Cyclosporine	400 mg	300 mg QD for 8 days	1.23 (1.19; 1.27)	1.01 (0.91; 1.11)	
Ethinyl estradiol and levonorgestrel 0.03 mg ethinyl estradiol and 0.15 mg levonorgestrel		200 mg QD for 6 days	0.91 (0.88; 0.94)	0.92 (0.84; 0.99)	
Hydrochlorothiazide	25 mg QD for 35 days	300 mg QD for 7 days	1.12 (1.08; 1.17)	1.15 (1.06; 1.25)	
Metformin	2,000 mg	300 mg QD for 8 days	1.10 (1.05; 1.15)	1.05 (0.96; 1.16)	
Probenecid	500 mg BID for 3 days	300 mg QD for 17 days	1.21 (1.16; 1.25)	1.13 (1.00; 1.28)

#### **13 NONCLINICAL TOXICOLOGY**

#### 13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

#### **Carcinogenesis**

Carcinogenicity was evaluated in 2-year studies conducted in CD1 mice and S prague-Dawley rats. Canagliflozin did not i ncrease t he i ncidence of t umors i n m ice dos ed a t 10, 30, or 100 mg/kg (less than or equal to 14 times exposure from a 300 mg clinical dose).

Testicular Leydig c ell t umors, c onsidered s econdary t o i ncreased l uteinizing hor mone (LH), increased s ignificantly i n male r ats at all d oses te sted (10, 30, and 100 mg/kg). In a 12-week clinical study, LH did not increase in males treated with canagliflozin.

Renal tubular adenoma and carcinoma increased significantly in male and female rats dosed at 100 mg/kg, or a pproximately 12-times e xposure f rom a 300 mg c linical dos e. A lso, a drenal pheochromocytoma i ncreased s ignificantly i n males and n umerically i n f emales d osed at 100 mg/kg. C arbohydrate m alabsorption associated w ith hi gh dos es of c anagliflozin w as considered a ne cessary proximal e vent in the e mergence of renal and adrenal tumors in rats. Clinical studies have not demonstrated carbohydrate m alabsorption in hu mans at c anagliflozin doses of up to 2-times the recommended clinical dose of 300 mg.

#### **Mutagenesis**

Canagliflozin w as n ot mutagenic w ith o r w ithout me tabolic a ctivation in the A mes a ssay. Canagliflozin w as mu tagenic in the *in vitro* mouse l ymphoma a ssay with but not w ithout metabolic a ctivation. C anagliflozin w as not m utagenic or c lastogenic i n a n *in vivo* oral micronucleus assay in rats and an *in vivo* oral Comet assay in rats.

#### Impairment of Fertility

Canagliflozin had no effects on the ability of rats to mate and sire or maintain a litter up to the high dose of 100 mg/kg (approximately 14 times and 18 times the 300 mg clinical dose in males and females, r espectively), a lthough there were minor a lterations in a number of r eproductive parameters (decreased s perm v elocity, i ncreased n umber of abnormal sperm, s lightly f ewer corpora l utea, f ewer i mplantation sites, a nd s maller litter s izes) at the h ighest d osage administered.

# **14 CLINICAL STUDIES**

INVOKANA (canagliflozin) has been studied as monotherapy, in combination with metformin, sulfonylurea, m etformin a nd s ulfonylurea, m etformin a nd s itagliptin, metformin a nd a thiazolidinedione (i.e., pi oglitazone), a nd i n c ombination w ith i nsulin (with or w ithout ot her antihyperglycemic a gents). T he ef ficacy o f INVOKANA w as compared t o a d ipeptidyl peptidase-4 (DPP-4) inhibitor (sitagliptin), both as add-on combination therapy with metformin and s ulfonylurea, and a s ulfonylurea (glimepiride), both a s a dd-on c ombination therapy with metformin. INVOKANA w as also e valuated i n a dults 55 to 80 years o f ag e and p atients w ith moderate renal impairment.

In patients with type 2 diabetes, treatment with INVOKANA produced clinically and statistically significant improvements in  $HbA_{1C}$  compared to placebo. Reductions in  $HbA_{1C}$  were observed across subgroups including age, gender, race, and baseline body mass index (BMI).

#### 14.1 Monotherapy

A total of 584 patients w ith t ype 2 di abetes inadequately c ontrolled on di et a nd e xercise participated i n a 2 6-week, doubl e-blind, pl acebo-controlled s tudy t o ev aluate t he efficacy and safety of INVOKANA. The mean age was 55 years, 44% of patients were men, and the mean baseline eGFR was 87 mL/min/1.73 m<sup>2</sup>. Patients taking other antihyperglycemic agents (N=281) discontinued the agent and underwent an 8-week w ashout followed by a 2-week, single-blind, placebo r un-in pe riod. P atients not t aking o ral antihyperglycemic a gents (N=303) entered t he 2-week, s ingle-blind, placebo r un-in pe riod di rectly. A fter t he placebo r un-in pe riod, pa tients were randomized to INVOKANA 100 mg, INVOKANA 300 mg, or placebo, administered once daily for 26 weeks.

At the end of treatment, INVOKANA 100 mg and 300 mg once daily resulted in a statistically significant improvement in HbA<sub>1C</sub> (p<0.001 for both doses) compared to placebo. INVOKANA 100 mg and 300 mg onc e da ily a lso r esulted in a greater proportion of pa tients a chieving a n HbA<sub>1C</sub> less t han 7%, i n s ignificant r eduction i n f asting pl asma glucose (FPG), i n i mproved postprandial glucose (PPG), a nd i n pe rcent bod y w eight r eduction c ompared t o pl acebo (see Table 9). S tatistically s ignificant ( p<0.001 f or both dos es) m ean c hanges f rom ba seline i n systolic blood pressure relative to placebo were -3.7 mmHg and -5.4 mmHg with INVOKANA 100 mg and 300 mg, respectively.

#### 14.2 Combination Therapy

#### Add-on Combination Therapy with Metformin

A total of 1284 patients with type 2 diabetes inadequately controlled on metformin monotherapy (greater than or equal to 2,000 mg/day, or at least 1,500 mg/day if higher dose not tolerated) participated i n a 2 6-week, doubl e-blind, pl acebo- and a ctive-controlled study to e valuate t he efficacy and safety of INVOKANA in combination with metformin. The mean age was 55 years, 47% of pa tients w ere men, and t he m ean baseline eG FR w as 8 9 mL/min/1.73 m<sup>2</sup>. Patients already on the required metformin dose (N=1009) were randomized after completing a 2-week, single-blind, pl acebo r un-in pe riod. P atients t aking l ess t han t he required metformin dose or patients o n me tformin in c ombination w ith a nother a ntihyperglycemic a gent (N=275) were switched t o metformin monotherapy ( at dos es described a bove) for at l east 8 weeks b efore entering the 2-week, single-blind, pl acebo run-in. After the placebo run-in period, patients were randomized t o INVOKANA 100 mg, INVOKANA 3 00 mg, s itagliptin 1 00 mg, o r pl acebo, administered once daily as add-on therapy to metformin.

At the end of treatment, INVOKANA 100 mg and 300 mg once daily resulted in a statistically significant improvement in HbA<sub>1C</sub> (p<0.001 for both doses) compared to placebo when added to metformin. INVOKANA 100 mg and 300 mg once daily also resulted in a greater proportion of patients ach ieving an H bA<sub>1C</sub> less than 7%, in s ignificant r eduction in f asting p lasma glucose (FPG), in improved postprandial glucose (PPG), and in percent body weight reduction compared to placebo when added to metformin (see Table 10). Statistically significant (p<0.001 for both doses) m ean c hanges f rom b aseline i n s ystolic bl ood p ressure r elative t o pl acebo were -5.4 mmHg and -6.6 mmHg with INVOKANA 100 mg and 300 mg, respectively.

Initial Combination Therapy with Metformin

A t otal of 1186 patients w ith t ype 2 d iabetes i nadequately controlled with d iet and ex ercise participated i n a 2 6-week doubl e-blind, a ctive-controlled, pa rallel-group, 5 -arm, mu lticenter study to evaluate the efficacy and safety of initial therapy with INVOKANA in combination with metformin XR. The median age was 56 years, 48% of patients were men, and the mean baseline eGFR w as 87.6 mL/min/1.73 m<sup>2</sup>. The median duration of di abetes w as 1.6 years, and 72 % of patients w ere t reatment naïve. After c ompleting a 2 -week s ingle-blind placebo r un-in pe riod, patients w ere r andomly as signed for a doubl e-blind t reatment pe riod of 26 weeks to 1 of 5 treatment groups (Table 11). The metformin XR dose was initiated at 500 mg/day for the first week of treatment and then increased to 1000 mg/day. Metformin XR or matching placebo was up-titrated every 2-3 weeks during the next 8 w eeks of treatment to a maximum daily dose of 1500 to 2000 mg/day, as tolerated; about 90% of patients reached 2000 mg/day.

At the end of treatment, INVOKANA 100 mg and INVOKANA 300 mg in combination with metformin XR resulted in a statistically significant greater improvement in  $HbA_{1C}$  compared to their respective INVOKANA doses (100 mg and 300 mg) alone or metformin XR alone.

 Table 11:
 Results from 26-Week Active-Controlled Clinical Study of INVOKANA Alone or INVOKANA as Initial Combination Therapy with Metformin\*

 Initial Combination Therapy with Metformin\*

There were 121 patients without week 26 efficacy data. Analyses addressing missing data gave consistent results with the results provided in this table.

#### INVOKANA Compared to Glimepiride, Both as Add-on Combination With Metformin

A total of 1450 patients with type 2 diabetes inadequately controlled on metformin monotherapy (greater than or equal to 2,000 mg/day, or at least 1,500 mg/day if higher dose not tolerated) participated in a 5 2-week, doubl e-blind, a ctive-controlled s tudy to evaluate the e fficacy and safety of INVOKANA in combination with metformin.

The m ean a ge w as 5 6 years, 52% of pa tients w ere m en, a nd t he m ean baseline eG FR w as 90 mL/min/ $1.73 \text{ m}^2$ . Patients tolerating ma ximally r equired me tformin d ose (N=928) w ere randomized a fter c ompleting a 2 -week, s ingle-blind, pl acebo run-in p eriod. Other p atients (N=522) w ere s witched t o m etformin m onotherapy ( at dos es de scribed a bove) f or at least 10 weeks, then completed a 2-week single-blind run-in period. A fter the 2-week run-in period, patients w ere randomized t o INVOKANA 1 00 mg, INVOKANA 300 mg, o r glimepiride (titration allowed throughout the 52-week study to 6 or 8 mg), administered once daily as add-on therapy to metformin.

As s hown in T able 12 and F igure 1, at the e nd of t reatment, INVOKANA 100 mg pr ovided similar reductions in HbA<sub>1C</sub> from baseline compared to glimepiride when added to metformin therapy. INVOKANA 300 mg provided a greater reduction from baseline in HbA<sub>1C</sub> compared to glimepiride, and the relative treatment difference was -0.12% (95% CI: -0.22; -0.02). As shown in T able 12, t reatment with INVOKANA 1 00 mg a nd 300 mg da ily pr ovided greater improvements in percent body weight change, relative to glimepiride.

Efficacy Parameter	INVOKANA 100 mg + Metformin (N=483)	INVOKANA 300 mg + Metformin (N=485)	Glimepiride (titrated) + Metformin (N=482)

#### Add-on Combination Therapy With Sulfonylurea

A total of 127 patients with type 2 diabetes inadequately controlled on sulfonylurea monotherapy participated in an 18-week, double-blind, placebo-controlled sub-study to evaluate the efficacy

and s afety of INVOKANA i n c ombination w ith s ulfonylurea. The m ean a ge w as 65 years, 57% of patients were men, and the mean baseline eGFR was 69 mL/min/1.73 m<sup>2</sup>. Patients treated with sulfonylurea monotherapy on a stable protocol-specified dose (greater than or equal to 50% maximal dose) for at least 10 weeks completed a 2-week, single-blind, placebo r un-in period. After t he run-in pe riod, pa tients w ith i nadequate glycemic control w ere randomized t o INVOKANA 100 mg, INVOKANA 300 mg, or placebo, a dministered once daily as add-on to sulfonylurea.

As shown in Table 13, at the end of treatment, INVOKANA 100 mg and 300 mg daily provided statistically s ignificant (p<0.001 for bot h dos es) i mprovements i n H bA<sub>1C</sub> relative t o p lacebo when added to sulfonylurea. INVOKANA 300 mg once daily compared to placebo resulted in a greater proportion of patients achieving an HbA<sub>1C</sub> less than 7%, (33% vs 5%), greater reductions in fasting plasma glucose (-36 mg/dL vs +12 mg/dL), and greater percent body weight reduction (-2.0% vs -0.2%).

#### Add-on Combination Therapy With Metformin and Sulfonylurea

A t otal of 469 patients w ith type 2 d iabetes inadequately c ontrolled o n t he c ombination o f metformin (greater than or equal to 2,000 mg/day or at least 1,500 mg/day if higher dose not tolerated) and sulfonylurea (maximal or near-maximal effective dose) participated in a 26-week, double-blind, pl acebo-controlled s tudy t o ev aluate t he efficacy and s afety of INVOKANA i n combination with metformin and sulfonylurea. The mean age was 57 years, 51% of patients were men, and t he m ean baseline eG FR w as 89 mL/min/1.73 m<sup>2</sup>. Patients a lready on t he pr otocol-specified doses of metformin and sulfonylurea (N=372) entered a 2-week, single-blind, placebo run-in period. Other patients (N=97) were required to be on a stable protocol-specified dose of metformin a nd s ulfonylurea f or a t le ast 8 weeks b efore entering t he 2-week r un-in period.

Following the run-in period, patients were randomized to INVOKANA 100 mg, INVOKANA 300 mg, or placebo, administered once daily as add-on to metformin and sulfonylurea.

At the end of treatment, INVOKANA 100 mg and 300 mg once daily resulted in a statistically significant improvement in HbA<sub>1C</sub> (p<0.001 for both doses) compared to placebo when added to metformin a nd s ulfonylurea. INVOKANA 100 mg a nd 300 mg o nce d aily also r esulted i n a greater pr oportion of patients a chieving an HbA<sub>1C</sub> less than 7%, in a significant r eduction i n fasting plasma glucose (FPG), and in percent body weight reduction compared to placebo when added to metformin and sulfonylurea (see Table 14).

#### Add-on Combination Therapy With Metformin and Sitagliptin

A to tal o f 217 patients w ith type 2 d iabetes inadequately c ontrolled o n t he c ombination o f metformin (greater t han or e qual to 1,500 mg/day) and s itagliptin 100 mg/day (or equivalent fixed-dose c ombination) participated i n a 26 -week, doubl e-blind, pl acebo-controlled s tudy t o evaluate the efficacy and safety of INVOKANA in combination with metformin and sitagliptin. The mean age was 57 years, 58% of patients were men, 73% of patients were Caucasian, 15% were A sian, and 12% were Black or A frican-American. T he mean baseline eG FR w as 90 mL/min/1.73 m<sup>2</sup> and the mean baseline BMI was 32 kg/m<sup>2</sup>. The mean duration of di abetes

was 10 years. Eligible patients entered a 2 -week, single-blind, placebo run-in period and were subsequently randomized to INVOKANA 100 mg or placebo, administered once daily as add-on to me tformin and sitagliptin. Patients with a b aseline eG FR of 70 mL/min/1.73 m<sup>2</sup> or g reater who were tolerating INVOKANA 100 mg and who required additional glycemic control (fasting finger stick 100 mg/dL or greater at least twice within 2 weeks) were up-titrated to INVOKANA 300 mg. While up-titration o ccurred as e arly as W eek 4, most (90%) patients randomized t o INVOKANA were up-titrated to INVOKANA 300 mg by 6 to 8 weeks.

At the end of 26 weeks, I NVOKANA resulted in a statistically significant improvement in  $HbA_{1C}$  (p<0.001) compared to placebo when added to metformin and sitagliptin.

 
 Table 15:

# INVOKANA Compared to Sitagliptin, Both as Add-on Combination Therapy With Metformin and Sulfonylurea

A t otal of 755 patients with type 2 d iabetes inadequately c ontrolled on t he c ombination of metformin (greater than or equal to 2,000 mg/day or at least 1,500 mg/day if higher dose not

tolerated) and sulfonylurea (near-maximal or maximal effective dose) participated in a 52-week, double-blind, active-controlled study to compare the efficacy and safety of INVOKANA 300 mg versus sitagliptin 100 mg in combination with metformin and sulfonylurea. The mean age was 57 years, 56% of p atients w ere m en, and t he m ean baseline eG FR w as 8 8 mL/min/1.73 m<sup>2</sup>. Patients a lready on pr otocol-specified dos es of metformin and sulfonylurea (N=716) en tered a 2-week single-blind, placebo run-in period. Other patients (N=39) were required to be on a stable protocol-specified dos e of metformin and sulfonylurea for at least 8 weeks before entering the 2-week r un-in period. Following the r un-in period, p atients w ere randomized to INVOKANA 300 mg or sitagliptin 100 mg as add-on to metformin and sulfonylurea.

As s hown in T able 16 and F igure 2, at the e nd of t reatment, INVOKANA 3 00 mg pr ovided greater H bA<sub>1C</sub> reduction c ompared t o s itagliptin 100 mg w hen a dded t o m etformin a nd sulfonylurea (p<0.05). INVOKANA 300 mg resulted in a mean percent change in body weight from baseline of -2.5% compared to +0.3% with sitagliptin 100 mg. A mean change in systolic blood pressure from baseline of -5.06 mmHg was observed with INVOKANA 300 mg compared to +0.85 mmHg with sitagliptin 100 mg.

# Add-On Combination Therapy With Insulin (With or Without Other Antihyperglycemic Agents)

A total of 1718 patients with type 2 diabetes inadequately controlled on insulin greater than or equal to 30 units/day or insulin in combination with other antihyperglycemic agents participated in an 18-week, double-blind, placebo-controlled substudy of a cardiovascular study to evaluate the efficacy and safety of INVOKANA in combination with insulin. The mean age was 63 years, 66% of p atients w ere m en, and the m ean baseline eG FR w as 75 mL/min/1.73 m<sup>2</sup>. Patients on basal, bolus, or basal/bolus insulin for at least 10 weeks entered a 2-week, single-blind, placebo run-in period. Approximately 70% of patients were on a background basal/bolus insulin regimen. After t he run-in pe riod, pa tients w ere r andomized t o INVOKANA 1 00 mg, I NVOKANA 300 mg, or placebo, administered once daily as add-on to insulin. The mean daily insulin dose at baseline was 83 units, which was similar across treatment groups.

At the of end of treatment, INVOKANA 100 mg and 300 mg once daily resulted in a statistically significant improvement in HbA<sub>1C</sub> (p<0.001 for both doses) compared to placebo when added to insulin. INVOKANA 100 mg and 300 mg on ce daily a lso r esulted in a greater proportion of patients a chieving an HbA<sub>1C</sub> less than 7%, in significant r eductions in fasting pl asma g lucose (FPG), and in percent body weight reductions compared to placebo (see Table 18). Statistically

significant (p<0.001 f or bot h dos es) m ean c hanges f rom ba seline i n s ystolic bl ood pr essure relative t o p lacebo w ere -2.6 mmHg and -4.4 mmHg with INVOKANA 1 00 mg and 300 mg, respectively.

# 14.3 Studies in Special Populations

#### Adults 55 to 80 Years of Age

A total of 714 older patients with type 2 diabetes inadequately controlled on current diabetes therapy (either d iet an d ex ercise al one o r i n combination w ith o ral o r p arenteral a gents) participated i n a 2 6-week, double-blind, placebo-controlled study to evaluate the efficacy and safety of INVOKANA in c ombination w ith c urrent di abetes t reatment. The m ean a ge w as 64 years, 5 5% o f p atients w ere m en, and t he mean baseline eG FR w as 7 7 mL/min/1.73 m<sup>2</sup>. Patients w ere r andomized t o t he a ddition of INVOKANA 100 mg, INVOKANA 3 00 mg, or placebo, administered o nce d aily. At the end o f treatment, INVOKANA provided statistically significant improvements from baseline relative to placebo in HbA<sub>1C</sub> (p<0.001 for both doses) of -0.57% (95% CI: -0.71; -0.44) for INVOKANA 100 mg and -0.70% (95% CI: -0.84; -0.57) for INVOKANA 300 mg. Statistically significant (p<0.001 for both doses) reductions from baseline in fasting plasma glucose (FPG) and body weight were also observed in this study relative to placebo *[see Use in Specific Populations (8.5)]*.

#### Moderate Renal Impairment

A total of 269 patients with type 2 diabetes and a b aseline eGFR of 30 mL/min/1.73 m<sup>2</sup> to less than 50 mL/min/1.73 m<sup>2</sup> inadequately c ontrolled on c urrent di abetes therapy participated i n a 26-week, double-blind, placebo-controlled clinical study to evaluate the efficacy and safety of INVOKANA in c ombination with c urrent diabetes treatment (diet or antihyperglycemic a gent therapy, with 95% of patients on insulin and/or sulfonylurea). The mean age was 68 years, 61% of p atients w ere m en, and t he m ean baseline eG FR w as 3 9 mL/min/1.73 m<sup>2</sup>. Patients w ere randomized t o t he addition of INVOKANA 100 mg, INVOKANA 3 00 mg, o r pl acebo, administered once daily.

At the end of treatment, INVOKANA 100 mg and INVOKANA 300 mg daily provided greater reductions in HbA<sub>1C</sub> relative to placebo (-0.30% [95% CI: -0.53; -0.07] and -0.40%, [95% CI: -0.64; -0.17], respectively) [see Warnings and Precautions (5.4), Adverse Reactions (6.1), and Use in Specific Populations (8.6)].

#### 16 HOW SUPPLIED/STORAGE AND HANDLING

INVOKANA (canagliflozin) tablets are available in the strengths and packages listed below:

100 mg t ablets ar e yellow, cap sule-shaped, f ilm-coated t ablets with "CFZ" on one s ide a nd "100" on the other side.

NDC 50458-140-30	Bottle of 30
NDC 50458-140-90	Bottle of 90
NDC 50458-140-50	Bottle of 500
NDC 50458-140-10	Blister package containing 100 tablets (10 blister cards containing 10 tablets each)

300 mg tablets are white, capsule-shaped, film-coated tablets with "CFZ" on one side and "300" on the other side.

NDC 50458-141-30	Bottle of 30
NDC 50458-141-90	Bottle of 90
NDC 50458-141-50	Bottle of 500
NDC 50458-141-10	Blister package containing 100 tablets (10 blister cards containing 10 tablets each)

#### Storage and Handling

Store at 25°C (77°F); excursions permitted to 15 to 30°C (59 to 86°F).

# 17 PATIENT COUNSELING INFORMATION

See FDA-approved patient labeling (Medication Guide).

#### **Instructions**

Instruct p atients to r ead th e M edication G uide b efore s tarting INVOKANA ( canagliflozin) therapy and to reread it each time the prescription is renewed.

Inform patients of the potential risks and benefits of INVOKANA and of alternative modes of therapy. Also inform patients about the importance of adherence to dietary instructions, regular physical ac tivity, pe riodic bl ood g lucose m onitoring a nd H bA<sub>1C</sub> testing, r ecognition a nd management of h ypoglycemia and h yperglycemia, and as sessment for diabetes complications. Advise patients to seek medical advice promptly during periods of stress such as fever, trauma, infection, or surgery, as medication requirements may change.

Instruct patients to take INVOKANA only as prescribed. If a dose is missed, advise patients to take it a s s oon a s it is remembered u nless it is almost time for the n ext d ose, in which c ase patients should skip the missed dose and take the medicine at the next regularly scheduled time. Advise patients not to take two doses of INVOKANA at the same time.

Inform patients that the most common adverse reactions associated with INVOKANA are genital mycotic infection, urinary tract infection, and increased urination.

Inform female patients of child bearing age that the use of INVOKANA during pregnancy has not been studied in humans, and that INVOKANA should only be used during pregnancy only if the potential benefit justifies the potential risk to the fetus. Instruct patients to report pregnancies to their physicians as soon as possible.

Inform nur sing m others t o di scontinue INVOKANA o r nur sing, t aking i nto account t he importance of drug to the mother.

#### Laboratory Tests

Due to its mechanism of action, patients taking INVOKANA will test positive for glucose in their urine.

#### Lower Limb Amputation

Inform patients that INVOKANA is associated with an increased risk of amputations. Counsel patients about the importance of routine preventative foot care. Instruct patients to monitor for new pain or tenderness, sores or ulcers, or infections involving the leg or foot and to seek medical advice immediately if such signs or symptoms develop [see Boxed Warning and Warnings and Precautions (5.1)].

#### **Hypotension**

Inform patients that symptomatic hypotension may occur with INVOKANA and advise them to contact their do ctor if they experience such symptoms [see Warnings and Precautions (5.2)].

42

Inform patients that dehydration may increase the risk for hypotension, and to have a dequate fluid intake.

#### **Ketoacidosis**

Inform patients that k etoacidosis is a serious life-threatening c ondition. Cases of ke toacidosis have been reported dur ing us e of INVOKANA. Instruct pa tients t o check ketones ( when possible) if symptoms consistent with ketoacidosis occur even if blood glucose is not elevated. If symptoms of k etoacidosis (including n ausea, vo miting, abdominal pain, tiredness, and labored breathing) o ccur, i nstruct pa tients t o di scontinue INVOKANA and s eek m edical advice immediately [see Warnings and Precautions (5.3)].

#### Acute Kidney Injury

Inform patients that acute kidney injury has been reported during use of INVOKANA. Advise patients to seek medical advice immediately if they have reduced oral intake (such as due to acute illness or fasting) or increased fluid losses (such as due to vomiting, diarrhea, or excessive heat exposure), as it may be appropriate to temporarily discontinue INVOKANA use in those settings [see Warnings and Precautions (5.4)].

#### Serious Urinary Tract Infections

Inform patients of the potential for urinary tract infections, which may be serious. Provide them with i nformation on the s ymptoms of ur inary t ract i nfections. A dvise t hem t o s eek m edical advice if such symptoms occur [see Warnings and Precautions (5.6)].

#### Genital Mycotic Infections in Females (e.g., Vulvovaginitis)

Inform female patients that vaginal yeast infection may occur and provide them with information on the signs and symptoms of vaginal yeast infection. Advise them of treatment options and when to seek medical advice [see Warnings and Precautions (5.8)].

# Genital Mycotic Infections in Males (e.g., Balanitis or Balanoposthitis)

Inform male patients that yeast in fection of penis (e.g., balanitis or balanoposthitis) may occur, especially in uncircumcised males and patients with prior history. Provide them with information on the signs and s ymptoms of balanitis and balanoposthitis (rash or redness of the glans or foreskin of the penis). Advise them of treatment options and when to seek medical advice [see Warnings and Precautions (5.8)].

#### Hypersensitivity Reactions

Inform patients that serious hypersensitivity reactions, such as urticaria, rash, anaphylaxis, and angioedema, have been reported with INVOKANA. Advise patients to report immediately any signs or symptoms suggesting allergic reaction, and to discontinue drug until they have consulted prescribing physicians.

#### Bone Fracture

Inform patients that bone fractures have been reported in patients taking INVOKANA. Provide them with information on factors that may contribute to fracture risk.

#### Pregnancy

Advise pregnant women, and females of reproductive potential of the potential risk to a fetus with treatment with INVOKANA [see Use in Specific Populations (8.1)]. Instruct females of reproductive potential to report pregnancies to their physicians as soon as possible.

#### Lactation

Advise women that breastfeeding is not recommended during treatment with INVOKANA [see Use in Specific Populations (8.2)].

#### Medication Guide INVOKANA<sup>®</sup> (in-vo-KAHN-uh) (canagliflozin) Tablets

#### What is the most important information I should know about INVOKANA?

INVOKANA can cause important side effects, including:

Amputations. INVOKANA may increase your risk of lower limb amputations. Amputations mainly involve removal of the toe or part of the foot, however, amputations involving the leg, below and above the knee, have also occurred. Some people had more than one amputation, some on both sides of the body. You may be at a higher risk of lower limb amputation if you:

- have a history of amputation
- have heart disease or are at risk for heart disease
- have had blocked or narrowed blood vessels, usually in your leg
- have damage to the nerves (neuropathy) in your leg 0
- o have had diabetic foot ulcers or sores

Call your doctor right away if you have new pain or tenderness, any sores, ulcers, or infections in your leg or foot. Your doctor may decide to stop your INVOKANA for a while if you have any of these signs or symptoms.

Talk to your doctor about proper foot care.

Dehydration, INVOKANA can cause some people to become dehydrated (the loss of too much body water). Dehydration may cause you to feel dizzy, faint, lightheaded, or weak, especially when you stand up (orthostatic hypotension).

You may be at higher risk of dehydration if you:

- o have low blood pressure
- o take medicines to lower your blood pressure, including diuretics (water pill)
- are on a low sodium (salt) diet 0
- have kidney problems 0
- are 65 years of age or older 0

Talk to your doctor about what you can do to prevent dehydration including how much fluid you should drink on a daily basis.

- Vaginal yeast infection. Women who take INVOKANA may get vaginal yeast infections. Symptoms of a vaginal yeast infection include:
  - vaginal odor 0
  - white or yellowish vaginal discharge (discharge may be lumpy or look like cottage cheese) 0
  - vaginal itching 0
- Yeast infection of the penis (balanitis or balanoposthitis). Men who take INVOKANA may get a yeast infection of . the skin around the penis. Certain men who are not circumcised may have swelling of the penis that makes it difficult to pull back the skin around the tip of the penis. Other symptoms of yeast infection of the penis include:
  - redness, itching, or swelling of the penis o rash of the penis 0
  - foul smelling discharge from the penis 0

- pain in the skin around penis 0

Talk to your doctor about what to do if you get symptoms of a yeast infection of the vagina or penis. Your doctor may suggest you use an over-the-counter antifungal medicine. Talk to your doctor right away if you use an over-the-counter antifungal medication and your symptoms do not go away.

#### What is INVOKANA?

- INVOKANA is a prescription medicine used along with diet and exercise to lower blood sugar in adults with type 2 • diabetes.
- INVOKANA is not for people with type 1 diabetes. •
- INVOKANA is not for people with diabetic ketoacidosis (increased ketones in blood or urine).
- It is not known if INVOKANA is safe and effective in children under 18 years of age.

#### Who should not take INVOKANA?

#### Do not take INVOKANA if you:

- are allergic to canagliflozin or any of the ingredients in INVOKANA. See the end of this Medication Guide for a list of • ingredients in INVOKANA. Symptoms of allergic reaction to INVOKANA may include:
  - 0 rash
  - raised red patches on your skin (hives) 0
  - swelling of the face, lips, mouth, tongue, and throat that may cause difficulty in breathing or swallowing 0

• have severe kidney problems or are on dialysis.

#### What should I tell my doctor before taking INVOKANA?

- Before you take INVOKANA, tell your doctor if you:
- have a history of amputation.
- have heart disease or are at risk for heart disease.
- have had blocked or narrowed blood vessels, usually in your leg.
- have damage to the nerves (neuropathy) in your leg.
- have had diabetic foot ulcers or sores.
- have kidney problems.
- have liver problems.
- have a history of urinary tract infections or problems with urination.
- are on a low sodium (salt) diet. Your doctor may change your diet or your dose of INVOKANA.
- are going to have surgery.
- are eating less due to illness, surgery, or a change in your diet.
- have or have had problems with your pancreas, including pancreatitis or surgery on your pancreas.
- drink alcohol very often, or drink a lot of alcohol in the short-term ("binge" drinking).
- have ever had an allergic reaction to INVOKANA.
- have other medical conditions.
- are pregnant or plan to become pregnant. INVOKANA may harm your unborn baby. If you become pregnant while taking INVOKANA, tell your doctor as soon as possible. Talk with your doctor about the best way to control your blood sugar while you are pregnant.
- are breastfeeding or plan to breastfeed. INVOKANA may pass into your breast milk and may harm your baby. Talk with your doctor about the best way to feed your baby if you are taking INVOKANA. Do not breastfeed while taking INVOKANA.

# Tell your doctor about all the medicines you take, including prescription and non-prescription medicines, vitamins, and herbal supplements.

INVOKANA may affect the way other medicines work, and other medicines may affect how INVOKANA works. Especially tell your doctor if you take:

• diuretics (water pills)

- rifampin (used to treat or prevent tuberculosis)
- phenytoin or phenobarbital (used to control seizures)
- ritonavir (Norvir<sup>®</sup>, Kaletra<sup>®</sup>)\* (used to treat HIV infection)
- digoxin (Lanoxin<sup>®</sup>)\* (used to treat heart problems)
- Ask your doctor or pharmacist for a list of these medicines if you are not sure if your medicine is listed above. Know the medicines you take. Keep a list of them and show it to your doctor and pharmacist when you get a new medicine.

#### How should I take INVOKANA?

- Take INVOKANA by mouth 1 time each day exactly as your doctor tells you to take it.
- Your doctor will tell you how much INVOKANA to take and when to take it. Your doctor may change your dose if needed.
- It is best to take INVOKANA before the first meal of the day.
- Your doctor may tell you to take INVOKANA along with other diabetes medicines. Low blood sugar can happen more often when INVOKANA is taken with certain other diabetes medicines. See "What are the possible side effects of INVOKANA?"
- If you miss a dose, take it as soon as you remember. If it is almost time for your next dose, skip the missed dose and take the medicine at the next regularly scheduled time. Do not take two doses of INVOKANA at the same time. Talk to your doctor if you have questions about a missed dose.
- If you take too much INVOKANA, call your doctor or go to the nearest hospital emergency room right away.
- When your body is under some types of stress, such as fever, trauma (such as a car accident), infection, or surgery, the amount of diabetes medicine you need may change. Tell your doctor right away if you have any of these conditions and follow your doctor's instructions.
- Stay on your prescribed diet and exercise program while taking INVOKANA.
- Check your blood sugar as your doctor tells you to.
- INVOKANA will cause your urine to test positive for glucose.
- Your doctor may do certain blood tests before you start INVOKANA and during treatment as needed. Your doctor may change your dose of INVOKANA based on the results of your blood tests.

47

#### What are the ingredients of INVOKANA?

Active ingredient: canagliflozin

Inactive ingredients: croscarmellose sodium, hydroxypropyl cellulose, lactose anhydrous, magnesium stearate, and microcrystalline cellulose. In addition, the tablet coating contains iron oxide yellow E172 (100 mg tablet only), macrogol/PEG, polyvinyl alcohol, talc, and titanium dioxide.
