Can Ginseng Save Your life ?

Pharmacological properties of Ginseng

Ginseng builds up general mental & physical vitality and resistance to disease by strengthening and stimulating the endocrine glands, which control all the fundamental physiological processes, including the metabolism of minerals and vitamins.

1. Stimulates the central nervous system

Ginseng improves mental conditions, preventing neurosis and nervous breakdown.

2. Speeds up recovery from fatigue

Ginseng reduces fatigue, increases stamina and strengthens the general physical condition.

3. Anti - stress, tonic

Ginseng helps the body to resist disease and poisonous toxins. The world pays more attention to ginseng as a long-term restorative because it is believed that its benefits to health accrue only from the gradual and continuous use of natural medicines.

4. Hematopoietic action

Ginseng exerts a hematopoietic action (formation of red blood cell), protecting against anemia, hypotension and heart ailments.
